

## Drug Coverage Policy

Effective Date ..... 5/1/2025  
Coverage Policy Number .....IP0129  
Title..... Tepezza

### Ophthalmology – Tepezza

- Tepezza™ (teprotumumab intravenous infusion – Horizon)

---

#### INSTRUCTIONS FOR USE

The following Coverage Policy applies to health benefit plans administered by Cigna Companies. Certain Cigna Companies and/or lines of business only provide utilization review services to clients and do not make coverage determinations. References to standard benefit plan language and coverage determinations do not apply to those clients. Coverage Policies are intended to provide guidance in interpreting certain standard benefit plans administered by Cigna Companies. Please note, the terms of a customer's particular benefit plan document [Group Service Agreement, Evidence of Coverage, Certificate of Coverage, Summary Plan Description (SPD) or similar plan document] may differ significantly from the standard benefit plans upon which these Coverage Policies are based. For example, a customer's benefit plan document may contain a specific exclusion related to a topic addressed in a Coverage Policy. In the event of a conflict, a customer's benefit plan document always supersedes the information in the Coverage Policies. In the absence of a controlling federal or state coverage mandate, benefits are ultimately determined by the terms of the applicable benefit plan document. Coverage determinations in each specific instance require consideration of 1) the terms of the applicable benefit plan document in effect on the date of service; 2) any applicable laws/regulations; 3) any relevant collateral source materials including Coverage Policies and; 4) the specific facts of the particular situation. Each coverage request should be reviewed on its own merits. Medical directors are expected to exercise clinical judgment where appropriate and have discretion in making individual coverage determinations. Where coverage for care or services does not depend on specific circumstances, reimbursement will only be provided if a requested service(s) is submitted in accordance with the relevant criteria outlined in the applicable Coverage Policy, including covered diagnosis and/or procedure code(s). Reimbursement is not allowed for services when billed for conditions or diagnoses that are not covered under this Coverage Policy (see "Coding Information" below). When billing, providers must use the most appropriate codes as of the effective date of the submission. Claims submitted for services that are not accompanied by covered code(s) under the applicable Coverage Policy will be denied as not covered. Coverage Policies relate exclusively to the administration of health benefit plans. Coverage Policies are not recommendations for treatment and should never be used as treatment guidelines. In certain markets, delegated vendor guidelines may be used to support medical necessity and other coverage determinations.

---

#### OVERVIEW

Tepezza, an insulin-like growth factor-1 receptor (IGF-1R) antagonist, is indicated for the treatment of **thyroid eye disease**, regardless of thyroid eye disease activity or duration.<sup>1</sup>

#### Dosing Information

The recommended dose is 10 mg/kg administered by intravenous (IV) infusion for the initial dose, followed by 20 mg/kg administered IV once every 3 weeks for seven additional doses.<sup>1</sup>

#### Disease Overview

Thyroid eye disease is a rare, autoimmune condition closely related to Graves' disease; this condition is also known as thyroid-associated ophthalmopathy, Graves' ophthalmopathy, and Graves' orbitopathy.<sup>2</sup> Thyroid eye disease is characterized by endomysial interstitial edema, expansion, and proliferation of cells within the fibrofatty compartment, resulting in clinical manifestations of periorbital edema, lid retraction, proptosis, diplopia, corneal breakdown and in rare cases, optic nerve compression. This disease is associated with major comorbidities that can lead to blindness.

Most patients with thyroid eye disease develop eye disease while being treated for hyperthyroidism under the care of an endocrinologist.<sup>2</sup> The overall prevalence of thyroid eye disease among patients with Graves' disease is up to 40%; moderate to severe and sight-threatening thyroid eye disease occurs in 6% and 0.5% of patients with Graves' disease, respectively. Risk factors for the development and severity of thyroid eye disease include older age, male sex, and genetic factors. Modifiable risk factors include cigarette smoking, thyroid dysfunction, and use of radioactive iodine.

### **Consensus Statement**

The American Thyroid Association and the European Thyroid Association issued a consensus statement in 2022 for the management of thyroid eye disease.<sup>2</sup> The Task Force notes "active" thyroid eye disease as disease with a clinical activity score (CAS) of  $\geq 3$  or if the patient has history or documentation of progression of thyroid eye disease based on subjective or objective worsening of vision, soft tissue inflammation, motility, or proptosis. CAS assesses seven items (spontaneous retrobulbar pain, pain on attempted up or lateral gaze, redness of the eyelids, redness of the conjunctiva, swelling of the eyelids, inflammation of the caruncle and/or plica, and conjunctival edema); each item is given one point if present. The severity of disease is divided into three groups: mild (features of disease have a minor impact on daily life insufficient to justify treatment), moderate (patient does not have sight-threatening disease but disease has sufficient impact on daily life to justify the risks of medical or surgical intervention), or sight-threatening (patient with dysthyroid optic neuropathy and/or corneal breakdown and/or globe subluxation). Pharmacologic treatment includes oral or intravenous (IV) glucocorticoids; mycophenolate, rituximab, Tepezza, and Actemra (tocilizumab IV infusion). Tepezza is noted as a preferred treatment with the following goals: disease inactivation and diplopia; reduction of proptosis; and improvement of eye motility. It is an acceptable treatment for disease inactivation and reduction of soft tissue involvement.

## **Coverage Policy**

### **POLICY STATEMENT**

**Prior Authorization is required for prescription benefit coverage of Tepezza. All approvals are provided for the duration noted below.**

**Tepezza is considered medically necessary when the following criteria are met:**

### **FDA-Approved Indication**

- 1. Thyroid Eye Disease.** Approve for 6 months if the patient meets the following (A, B, C, and D):

Note: Thyroid Eye Disease is also recognized as Graves' ophthalmopathy, Graves' orbitopathy, thyroid-associated ophthalmopathy, and thyroid orbitopathy.

**A)** Patient is  $\geq 18$  years of age; AND

**B)** Patient has been assessed as having at least moderate severity level of disease based on signs and symptoms, according to the prescriber; AND

**Note:** Examples of signs and symptoms of disease of at least moderate severity include the following: lid retraction  $\geq$  2 mm, moderate or severe soft tissue involvement, proptosis  $\geq$  3 mm above normal for race and sex, and diplopia (Gorman score 2 to 3).

**C)** Patient has not received 8 doses (total) of Tepezza; AND

**Note:** The maximum recommended treatment is for 8 doses. For a patient who has started therapy but has not completed 8 doses, approve the number of doses required for the patient to receive a total of 8 doses.

**D)** The medication is prescribed by or in consultation with an ophthalmologist, endocrinologist, or a physician who specializes in thyroid eye disease.

**Dosing:** Up to 20 mg/kg per dose administered by intravenous infusion no more frequently than every 3 weeks for 8 doses

When coverage is available and medically necessary, the dosage, frequency, duration of therapy, and site of care should be reasonable, clinically appropriate, and supported by evidence-based literature and adjusted based upon severity, alternative available treatments, and previous response to therapy.

Receipt of sample product does not satisfy any criteria requirements for coverage.

**Tepezza for any other use is considered not medically necessary. Criteria will be updated as new published data are available.**

## Coding Information

- Note: 1) This list of codes may not be all-inclusive.  
2) Deleted codes and codes which are not effective at the time the service is rendered may not be eligible for reimbursement.

**Considered Medically Necessary when criteria in the applicable policy statements listed above are met:**

HCPCS Codes	Description
J3241	Injection, teprotumumab-trbw, 10 mg

## Revision Details

Type of Revision	Summary of Changes	Date
Annual Review	<b>Thyroid Eye Disease:</b> Removed if the individual is a smoker, smoking cessation has been discussed	5/1/2024

	<p><b>Thyroid Eye Disease:</b> The criterion that the patient has active disease of at least moderate severity based on signs and symptoms, according to the prescriber was changed to remove the word "active". The new criterion requires that the patient has at least moderate severity level of disease based on signs and symptoms, according to the prescriber. The Note was also revised to read: Examples of signs and symptoms of disease of at least moderate severity include the following: lid retraction <math>\geq</math> 2 mm, moderate or severe soft tissue involvement, proptosis <math>\geq</math> 3 mm above normal for race and sex, and diplopia (Gorman score 2 to 3).</p>	
Annual Revision	<b>No criteria changes</b>	5/1/2025

The policy effective date is in force until updated or retired.
